

JavaScript, Sixth Edition

Chapter 5

Working with the Document Object Model (DOM) and DHTML

Objectives

When you complete this chapter, you will be able to:

- Access elements by id, tag name, class, name, or selector
- Access element content, CSS properties, and attributes
- Add and remove document nodes
- Create and close new browser tabs and windows with an app

JavaScript, Sixth Edition

2

Objectives (cont'd.)

When you complete this chapter, you will be able to:

- Use the `setTimeout()` and `setInterval()` methods to specify a delay or a duration
- Use the `History`, `Location`, `Navigation`, and `Screen` objects to manipulate the browser window

JavaScript, Sixth Edition

3

Understanding the Browser Object Model and the Document Object Model

- JavaScript treats web page content as set of related components
 - objects
- Every element on web page is an object
- You can also create objects
 - a function is an object

JavaScript, Sixth Edition

4

Understanding the Browser Object Model

- Browser object model (BOM) or client-side object model
 - Hierarchy of objects
 - Each provides programmatic access
 - To a different aspect of the web browser window or the web page
- **Window object**
 - Represents a Web browser window
 - Called the global object
 - Because all other BOM objects contained within it

JavaScript, Sixth Edition

5

Understanding the Browser Object Model (cont'd.)

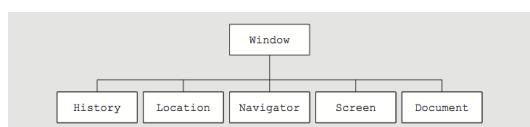

Figure 5-3 Browser object model

JavaScript, Sixth Edition

6

The Document Object Model

- Document object
 - Represents the Web page displayed in a browser
 - Contains all Web page elements
 - JavaScript represents each element by its own object

JavaScript, Sixth Edition

7

The DOM and DHTML

- Dynamic HTML (DHTML)
 - Interaction can change content of web page without reloading
 - Can also change presentation of content
 - Combination of HTML, CSS, and JavaScript
- DOM
 - example of an application programming interface (API)
 - structure of objects with set of properties and methods

JavaScript, Sixth Edition

8

The DOM tree

- The DOM hierarchy depends on a document's contents

```

1 <html lang="en">
2   <head>
3     <meta charset="utf-8" />
4     <title>Photo Gallery</title>
5   </head>
6   <body>
7     <header>
8       <h1>Garden Photo</h1>
9     </header>
10    <article>
11      <figure>
12        <figcaption>Butterfly bush</figcaption>
13        
14      </figure>
15    </article>
16  </body>
17 </html>

```

JavaScript, Sixth Edition

9

The DOM tree (cont'd.)

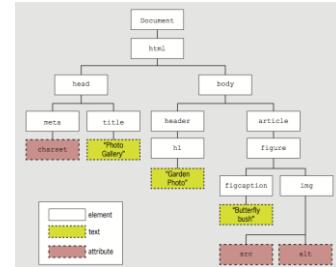

Figure 5-4 Example DOM tree

JavaScript, Sixth Edition

10

The DOM tree

- Each item in the DOM tree is a node
- Element, attribute, and text content nodes are most commonly used

JavaScript, Sixth Edition

11

DOM Document Object Methods

METHOD	DESCRIPTION
getElementById(ID)	Returns the element with the id value ID
getElementsByName(name)	Returns the collection of elements with the name name
getElementsByTagName(tag)	Returns the collection of elements with the tag (element) name tag
querySelectorAll(selector)	Returns the collection of elements that match the CSS selector specified by selector
write(text)	Writes text to the document

Table 5-1 HTML DOM Document object methods

JavaScript, Sixth Edition

12

DOM Document Object Properties

PROPERTY	DESCRIPTION
body	Document's body element
cookie	Current document's cookie string, which contains small pieces of information about a user that are stored by a web server in text files on the user's computer
domain	Domain name of the server where the current document is located
lastModified	Date the document was last modified
location	Location of the current document, including its URL
referrer	URL of the document that provided a link to the current document
title	Title of the document as specified by the title element in the document head section
URL	URL of the current document

Table 5-2 Selected DOM Document object properties

JavaScript, Sixth Edition

13

Accessing Document Elements, Content, Properties, and Attributes

- Methods such as `getElementById()` are methods of the Document object
- Several methods available for JavaScript to reference web page elements

JavaScript, Sixth Edition

14

Accessing Elements by id value

- Set the id value in HTML
- `getElementById()` method
 - Returns the first element in a document with a matching id attribute
- Example:

HTML element with id value

```
<input type="number" id="zip" />
```

JavaScript to reference HTML element

```
var zipField = document.getElementById("zip");
```

JavaScript, Sixth Edition

15

Accessing Elements by Tag Name

- `getElementsByName()` method
 - Returns array of elements matching a specified tag name
 - Tag name is name of element
- Method returns a set of elements
 - Node list is indexed collection of nodes
 - HTML collection is indexed collection of HTML elements
 - Either set uses array syntax

JavaScript, Sixth Edition

16

Accessing Elements by Tag Name (cont'd.)

- Example:
 - Index numbers start at 0, so second element uses index number 1
 - To work with the second h1 element on a page:

```
var secondH1 = document.getElementsByTagName("h1")[1];
```

JavaScript, Sixth Edition

17

Accessing Elements by Class Name

- `getElementsByClassName()` method
 - Returns node list or HTML collection of elements with a class attribute matching a specified value
- Example
 - All elements with class value side:

```
var sideElements = document.getElementsByClassName("side");
```

JavaScript, Sixth Edition

18

Accessing Elements by Class Name (cont'd.)

- class attribute takes multiple values, so getElementsByClassName() method takes multiple arguments
- Arguments enclosed in single set of quotes, with class names separated by spaces
- Example
 - All elements with class values side and green:

```
var sideGreenElements = document.getElementsByClassName("side green");
```

JavaScript, Sixth Edition

19

Accessing Elements by Name

- getElementsByName() method
 - Returns node list or HTML collection of elements with a name attribute matching a specified value
- Not as useful as preceding options
 - But creates more concise code when accessing set of option buttons or check boxes in a form:
- Not standard in IE9 and earlier versions of IE, so important to test

JavaScript, Sixth Edition

20

Accessing Elements with CSS Selectors

- querySelector() method
 - References elements using CSS syntax
 - Returns first occurrence of element matching a CSS selector
- Example:

```
HTML:
<header>
  <h1></h1>
</header>
JavaScript to reference img element
querySelector("header h1 img")
```

JavaScript, Sixth Edition

21

Accessing Elements with CSS Selectors (cont'd)

- IE8 supports only simple selectors
 - Can use different approach in creating CSS selector
 - Previous example could be rewritten as

```
querySelector("img.logo")
```

JavaScript, Sixth Edition

22

Accessing Elements with CSS Selectors (cont'd)

- querySelectorAll() method
 - Returns collection of elements matching selector
 - Different from querySelector() method, which returns only first occurrence
- Example:

```
HTML:
<nav>
  <ul>
    <li>About Us</li>
    <li>Order</li>
    <li>Support</li>
  </ul>
</nav>
```

JavaScript to reference all three li elements:

```
querySelectorAll("nav ul li")
```

JavaScript, Sixth Edition

23

Accessing an Element's Content

- textContent property
 - Accesses and changes text that an element contains
 - Unlike innerHTML, textContent strips out HTML tags
- Example:

```
HTML:
<ul class="topNav"><a href="#aboutus.html">About Us</a></li>
<li class="topNav"><a href="#order.html">Order</a></li>
<li class="topNav"><a href="#support.html">Support</a></li>
</ul>
```

JavaScript to reference and access first li element:

```
var button1 = querySelectorAll("ul.topNav")[0];
var allContent = button1.innerHTML;
// <a href="#aboutus.html">About Us</a>
var justText = button1.textContent;
// About Us
```

JavaScript, Sixth Edition

24

Accessing an Element's Content (cont'd)

- `textContent` property is more secure
 - Not supported by IE8 or earlier
 - Some developers use `if/else` construction to implement `textContent` only on supported browsers

JavaScript, Sixth Edition

25

Accessing an Element's CSS Properties

- Can access CSS properties through DOM
 - Use dot notation
 - Reference element's style property followed by name of CSS property
 - Example: change value of CSS `display` property to `none` for element with `id` value `logo`:

```
document.getElementById("logo").style.display = "none";
```

JavaScript, Sixth Edition

26

Accessing an Element's CSS Properties (cont'd.)

- When CSS property includes hyphen (-), remove hyphen and capitalize letter following hyphen
 - Use dot notation
 - `font-family` becomes `fontFamily`
 - Example:

```
var font = document.getElementById("logo").style.fontFamily;
```
- CSS value specified using DOM reference is an inline style
 - Higher priority than embedded or external styles

JavaScript, Sixth Edition

27

Accessing an Element's CSS Properties (cont'd.)

- To remove a style you previously added with a DOM reference
 - set its value to an empty string
 - Example:

```
document.getElementById("navbar").style.color = "";
```

JavaScript, Sixth Edition

28

Accessing Element Attributes

- Access element attribute with period and name of attribute after element reference
 - Reference element with `id` value `homeLink`:

```
document.getElementById("homeLink")
```

 - Reference `href` attribute of same element:

```
document.getElementById("homeLink").href
```
- Can use to look up attribute value and assign to variable, or to assign new value to attribute

JavaScript, Sixth Edition

29

Accessing Element Attributes (cont'd)

- One exception for accessing element attributes
 - Must use property name `className` to refer to `class` attribute values
 - Single class value returned like standard attribute value
 - Multiple class values returned in single string, separated by spaces

JavaScript, Sixth Edition

30

Adding and Removing Document Nodes

- DOM includes methods to change DOM tree
 - Can create brand new elements
 - Can add/remove elements from DOM tree

JavaScript, Sixth Edition

31

Creating Nodes

- createElement() method**
 - Creates a new element
 - Syntax:
`document.createElement("element")`
 - `element` is an element name
- Example:**
 - To create a new `div` element:

```
document.createElement("div");
```

JavaScript, Sixth Edition

32

Attaching Nodes

- Newly created node is independent of DOM tree
- appendChild() method**
 - Attaches node to DOM tree
 - Syntax:
`parentNode.appendChild(childNode)`
 - `childNode` is node to be attached
 - `parentNode` is node to attach child node to

JavaScript, Sixth Edition

33

Attaching Nodes (cont'd.)

- Example:**
 - Create new `li` element and attach to element with `id` value `navList`:

```
var list = document.getElementById("navList");
var contact = document.createElement("li");
list.appendChild(contact);
```
- Document fragment**
 - Set of connected nodes not part of document
 - Can use `appendChild()` to add document fragment to DOM tree for a document

JavaScript, Sixth Edition

34

Attaching Nodes (cont'd.)

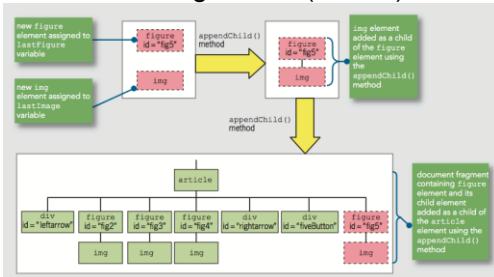

Table 5-7 Using the `appendChild()` method to attach nodes

JavaScript, Sixth Edition

35

Cloning Nodes

- Create new node same as existing node
- cloneNode() method**
- Syntax:**
 - `existingNode.cloneNode(true | false)`
 - `true` argument clones child nodes
 - `false` argument clones only specified parent node
- Example:**

```
document.createElement("div");
```

JavaScript, Sixth Edition

36

Cloning Nodes (cont'd.)

- Example:

```
var contact = document.createElement("li");
contact.className = "mainNav";
```

```
var directions = contact.cloneNode(true);
```

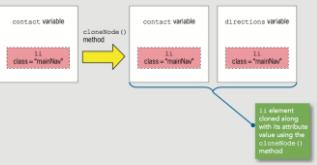

Figure 5-10 Using the `cloneNode()` method

JavaScript, Sixth Edition

37

Inserting Nodes at Specific Positions in the Document Tree

- New node created with `createElement()` is not attached to document tree
- `appendChild()` adds node after existing child nodes
- To specify a different position, use `insertBefore()`
- Syntax:
 - `parentNode.insertBefore(newChildNode, existingChildNode)`

JavaScript, Sixth Edition

38

Inserting Nodes at Specific Positions in the Document Tree (cont'd.)

- Example:

- HTML:

```
<ul id="topnav">
  <li><a href="#">About Us</a></li>
  <li><a href="#">Order</a></li>
  <li><a href="#">Support</a></li>
</ul>
```

- JavaScript:

```
var list = document.getElementById("topnav");
var directions = document.createElement("li");
directions.innerHTML = "Directions";
var aboutus = document.querySelectorAll("#topnav li")[0];
list.insertBefore(directions, aboutus);
```

JavaScript, Sixth Edition

39

Inserting Nodes at Specific Positions in the Document Tree (cont'd.)

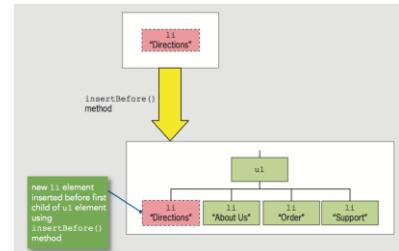

Figure 5-14 Using the `insertBefore()` method

JavaScript, Sixth Edition

40

Removing Nodes

- `removeNode()` removes node from DOM tree

- Syntax:
 - `parentNode.removeChild(childNode)`

- Can assign removed node to variable:

```
var list = document.getElementById("topnav");
var aboutus = document.querySelectorAll("#topnav li")[0];
var aboutNode = list.removeChild(aboutus);
```

– Node removed without being assigned to a variable is deleted during garbage collection

JavaScript, Sixth Edition

41

Manipulating the Browser with the Window Object

- Window object

- Includes properties containing information about the web browser window or tab
- Contains methods to manipulate the web browser window or tab itself

JavaScript, Sixth Edition

42

Manipulating the Browser with the Window Object (cont'd.)

PROPERTY	DESCRIPTION
closed	Boolean value that indicates whether a window or tab has been closed
document	Reference to the Document object
history	Reference to the History object
innerHeight	Height of the window area that displays content
innerWidth	Width of the window area that displays content, including the scrollbar if present
location	Reference to the Location object
name	Name of the window or tab
navigator	Reference to the Navigator object
opener	Reference to the window that opened the current window or tab
outerHeight	Height of the entire browser window
outerWidth	Width of the entire browser window
screen	Reference to the Screen object
self	Self-reference to the Window object; Identical to the window property
status	Temporary text that is written to the status bar
window	Self-reference to the Window object; Identical to the self property

Table 5-3 Window object properties

JavaScript, Sixth Edition

43

Manipulating the Browser with the Window Object (cont'd.)

METHOD	DESCRIPTION
alert()	Displays a simple message dialog box with an OK button
blur()	Removes focus from a window or tab
clearInterval()	Cancels an interval that was set with setInterval()
clearTimeout()	Cancels a timeout that was set with setTimeout()
close()	Closes a web browser window or tab
confirm()	Displays a confirmation dialog box with OK and Cancel buttons
focus()	Makes a Window object the active window or tab
moveBy()	Moves the window relative to the current position
moveTo()	Moves the window to an absolute position
open()	Opens a new web browser window or tab
print()	Prints the document displayed in the current window or tab
prompt()	Displays a dialog box prompting a user to enter information

Table 5-4 Window object methods (continues)

JavaScript, Sixth Edition

44

Manipulating the Browser with the Window Object (cont'd.)

METHOD	DESCRIPTION
resizeBy()	Resizes a window by a specified amount
resizeTo()	Resizes a window to a specified size
scrollBy()	Scrolls the window or tab by a specified amount
scrollTo()	Scrolls the window or tab to a specified position
setInterval()	Repeatedly executes a function after a specified number of milliseconds have elapsed
setTimeout()	Executes a function once after a specified number of milliseconds have elapsed

Table 5-4 Window object methods

JavaScript, Sixth Edition

45

Manipulating the Browser with the Window Object (cont'd.)

- **self** property
 - Refers to the current Window object
 - Identical to using the window property to refer to the Window object
 - Examples:
 - `window.close();`
 - `self.close();`
- Web browser assumes reference to global object
- Good practice
 - Use `window` or `self` references
 - When referring to a Window object property or method

JavaScript, Sixth Edition

46

Opening and Closing Windows

- Reasons to open a new Web browser window
 - To launch a new Web page in a separate window
 - To use an additional window to display information
- When new Web browser window opened:
 - New Window object created
 - Represents the new window
- Know how to open a link in a new window using the `a` element's `target` attribute

```
<a href="http://www.wikipedia.org/">
        target="wikiWindow">Wikipedia home page</a>
```

JavaScript, Sixth Edition

47

Opening a Window

- `open()` method of the Window object
 - Opens new windows
- Syntax

`window.open(url, name, options, replace);`

METHOD	DESCRIPTION
resizeBy()	Resizes a window by a specified amount
resizeTo()	Resizes a window to a specified size
scrollBy()	Scrolls the window or tab by a specified amount
scrollTo()	Scrolls the window or tab to a specified position
setInterval()	Repeatedly executes a function after a specified number of milliseconds have elapsed
setTimeout()	Executes a function once after a specified number of milliseconds have elapsed

Table 5-5 Arguments of the Window object's `open()` method

JavaScript, Sixth Edition

48

Opening a Window (cont'd.)

- Include all (or none) `window.open()` method arguments
- Example:

```
- window.open("http://www.wikipedia.org");
```

JavaScript, Sixth Edition

49

Opening a Window (cont'd.)

- Customize new browser window or tab appearance
 - Use `window.open()` method options argument

NAME	DESCRIPTION
height	Sets the window's height
left	Sets the horizontal coordinate of the left of the window, in pixels
location	Includes the URL location text box
menubar	Includes the menu bar
personalbar	Includes the bookmarks bar (or other user-customizable bar)
resizable	Determines if the new window can be resized
scrollbars	Includes scroll bars
status	Includes the status bar
toolbar	Includes the Standard toolbar
top	Sets the vertical coordinate of the top of the window, in pixels
width	Sets the window's width

Table 5-6 Common options of the Window object's `open()` method

JavaScript, Sixth Edition

50

Opening a Window (cont'd.)

- `window.open()` method name argument
 - Same as value assigned to the `target` attribute
 - Specifies window name where the URL should open
 - If name argument already in use
 - JavaScript changes focus to the existing Web browser window instead of creating a new window

JavaScript, Sixth Edition

51

Opening a Window (cont'd.)

- Window object's name property used to specify a target window with a link
 - Cannot be used in JavaScript code
- Assign the new Window object created with the `window.open()` method to a variable to control it
- `focus()` method
 - Makes a window the active window

JavaScript, Sixth Edition

52

Closing a Window

- `close()` method
 - Closes a web browser window
- `window.close()` or `self.close()`
 - Closes the current window

JavaScript, Sixth Edition

53

Working with Timeouts and Intervals

- Window object's timeout and interval methods
 - Creates code that executes automatically
- `setTimeout()` method
 - Executes code after a specific amount of time
 - Executes only once
 - Syntax
 - `var variable = setTimeout("code", milliseconds);`
- `clearTimeout()` method
 - Cancel `setTimeout()` before its code executes
- Example on next slide

JavaScript, Sixth Edition

54

Working with Timeouts and Intervals (cont'd.)

```
var buttonNotPressed = setTimeout("window.alert('Your changes have been saved')", 10000);

function buttonPressed() {
    clearTimeout(buttonNotPressed);
    window.open(index.htm);
}
```

JavaScript, Sixth Edition

55

Working with Timeouts and Intervals (cont'd.)

- **setInterval () method**
 - Repeatedly executes the same code after being called only once
 - Syntax:
 - `var variable = setInterval("code", milliseconds);`
- **clearInterval () method**
 - Used to clear `setInterval ()` method call

JavaScript, Sixth Edition

56

The History Object

- **History object**
 - Maintains internal list (history list)
 - All documents opened during current web browser session
- **Security features**
 - Will not display URLs contained in the history list

JavaScript, Sixth Edition

57

The History Object (cont'd.)

METHOD	DESCRIPTION
<code>back()</code>	Produces the same result as clicking a browser's Back button
<code>forward()</code>	Produces the same result as clicking a browser's Forward button
<code>go()</code>	Opens a specific document in the history list

Table 5-7 Methods of the `History` object

JavaScript, Sixth Edition

58

The History Object (cont'd.)

- **go () method**
 - Allows navigation to a specific previously visited web page
- **History object length property**
 - Provides specific number of documents opened during the current browser session
 - Example:
 - Return to first document opened in current browser session:

```
history.go(-(history.length - 1));
```

JavaScript, Sixth Edition

59

The Location Object

- **Location object**
 - Allows changes to a new web page from within JavaScript code
- **Location object properties allow modification of URL individual portions**
 - Web browser automatically attempts to open that new URL

JavaScript, Sixth Edition

60

The Location Object (cont'd.)

PROPERTIES	DESCRIPTION
hash	URL's anchor
host	Host and domain name (or IP address) of a network host
hostname	Combination of the URL's host name and port sections
href	Full URL address
pathname	URL's path
port	URL's port
protocol	URL's protocol
search	URL's search or query portion

Table 5-8 Properties of the Location object

METHOD	DESCRIPTION
assign()	Loads a new web page
reload()	Causes the page that currently appears in the web browser to open again
replace()	Replaces the currently loaded URL with a different one

Table 5-9 Methods of the Location object

JavaScript, Sixth Edition

61

The Location Object (cont'd.)

- Location object's `assign()` method
 - Same action as changing the `href` property
 - Loads a new web page
- Location object's `reload()` method
 - Equivalent to the browser Reload or Refresh button
 - Causes current page to open again
- Location object's `replace()` method
 - Replaces currently loaded URL with a different one

JavaScript, Sixth Edition

62

The Navigator Object

• Navigator object

- Obtains information about current web browser
- Example: determine type of web browser running

PROPERTIES	DESCRIPTION
appName	Name of the web browser displaying the page
appVersion	Version of the web browser displaying the page
geolocation	API for accessing the user's current location and user permission settings, denying or allowing access to that information
online	Whether the browser currently has a network connection
platform	Operating system in use on the client computer
userAgent	String stored in the HTTP user-agent request header, which contains information about the browser, the platform name, and compatibility

Table 5-10 Properties of the Navigator object

JavaScript, Sixth Edition

63

The Navigator Object (cont'd.)

```
console.log("Web browser name: " + navigator.appName);
console.log("Web browser version: " + navigator.appVersion);
console.log("Operating platform: " + navigator.platform);
console.log("User agent: " + navigator.userAgent);
```

Figure 5-19 Navigator object properties in Firefox console

JavaScript, Sixth Edition

64

The Screen Object

• Screen object

- Obtains information about display screen's size, resolution, color depth

• Common use of Screen object properties

- Centering a web browser window in the middle of the display area

JavaScript, Sixth Edition

65

The Screen Object (cont'd.)

PROPERTIES	DESCRIPTION
availHeight	Height of the display screen, not including operating system features such as the Windows taskbar
availWidth	Width of the display screen, not including operating system features such as the Windows taskbar
colorDepth	Display screen's bit depth if a color palette is in use; if a color palette is not in use, returns the value of the <code>pixelDepth</code> property
height	Height of the display screen
pixelDepth	Display screen's color resolution in bits per pixel
width	Width of the display screen

Table 5-11 Properties of the Screen object

JavaScript, Sixth Edition

66

The Screen Object (cont'd.)

- Common Screen object properties uses
 - Center a web browser window

Example:

```
var winWidth = 300;
var winHeight = 200;
var leftPosition = (screen.width - winWidth) / 2;
var topPosition = (screen.height - winHeight) / 2;
var optionString = "width=" + winWidth + ",height=" +
  winHeight + ",left=" + leftPosition + ",top=" +
  topPosition;

var openWin = window.open("", "CtrlWindow", optionString);
```

JavaScript, Sixth Edition

67

Summary

- Browser object model (BOM) or client-side object model
 - Hierarchy of objects
- Top-level object in the browser object model
 - Window object
- Document object: most important object
- DOM represents web page displayed in window

JavaScript, Sixth Edition

68

Summary (cont'd.)

- Access elements with `getElementById()`, `getElementsByName()`, `getElementsByClassName()`, `getElementsByTagName()`, `querySelector()`, or `querySelectorAll()`
- Access element content with `textContent()` or `innerHTML()` property
- Access CSS properties using an element's JavaScript `style` property

JavaScript, Sixth Edition

69

Summary (cont'd.)

- Create new node with `createElement()`
- Attach node with `appendChild()`
- Clone node with `cloneNode()`
- Attach node in specific place with `insertBefore()`
- Remove node with `removeNode()`
- Open new window with `window.open()`
- Close window with `window.close()`

JavaScript, Sixth Edition

70

Summary (cont'd.)

- `setTimeout()` executes code after specific amount of time
- `clearTimeout()` cancels `setTimeout()`
- `setInterval()` executes code repeatedly
- `clearInterval()` cancels `setInterval()`

JavaScript, Sixth Edition

71

Summary (cont'd.)

- History object maintains an opened documents history list
- Location object allows changes to a new web page from within JavaScript code
- Navigator object obtains information about the current web browser
- Screen object obtains information about the display screen's size, resolution, color depth

JavaScript, Sixth Edition

72
