

Chapter 9

How to work with strings and numbers

Murach's PHP and MySQL (3rd Ed.)

C9, Slide 1

Objectives (continued)

Knowledge (continued)

- Describe the PHP `is_infinite()` and `is_finite()` functions, and describe these PHP constants: `PHP_INT_MAX`, `INF`, and `-INF`.
- Describe these PHP functions for working with numbers: `max()`, `min()`, `pow()`, `round()`, `sqrt()`, `rand()`, `mt_rand()`, and `random_int()`.
- Describe the use of the `sprintf()` function for formatting strings and numbers.
- Describe the use of type casting and the use of the `intval()` and `floatval()` functions.

Murach's PHP and MySQL (3rd Ed.)

C9, Slide 4

Objectives

Applied

- Use any of the functions and techniques presented in this chapter to work with strings.
- Use any of the functions and techniques presented in this chapter to work with numbers.

Murach's PHP and MySQL (3rd Ed.)

C9, Slide 2

Assign strings with single quotes

```
$language = 'PHP';
$message = 'Welcome to ' . $language;

$query = 'SELECT firstName, lastName
FROM Users';
```

Assign strings with double quotes

Using variable substitution

```
$language = "PHP";
$message = "Welcome to $language";
```

Using braces with variable substitution

```
$count = 12;
$item = "flower";
$message1 = "You bought $count $items.";
$message2 = "You bought $count ${item}s.";
```

Murach's PHP and MySQL (3rd Ed.)

C9, Slide 5

Objectives (continued)

Knowledge

- Describe the way variable substitution is used to assign a string to a variable.
- Describe the way PHP escape sequences can be used to insert special characters into strings and how the `htmlspecialchars()` function can be used to display special characters correctly in a browser.
- Describe these terms as they apply to a PHP string: length, substring, and position.
- Describe the use of the PHP string functions that return string lengths or substrings, search for or replace characters in a string, modify a string, convert between strings and arrays, and compare two strings.

Murach's PHP and MySQL (3rd Ed.)

C9, Slide 3

Assign a string with a heredoc

```
$language = 'PHP';
$message = <<<MESSAGE
The heredoc syntax allows you to build multi-line
strings in $language. Inside, it acts like a
double-quoted string and performs variable substitution.
MESSAGE;
```

Assign a string with a nowdoc

```
$message = <<<'MESSAGE'
The nowdoc syntax also allows you to build multi-line
strings in PHP. However, no variable substitution takes
place inside the nowdoc string. This is similar to
single-quoted strings.
MESSAGE;
```

Murach's PHP and MySQL (3rd Ed.)

C9, Slide 6

Key terms

- Heredoc
- Nowdoc
- Variable substitution
- Interpolation

**The htmlentities() function**

```
htmlspecialchars($str [, $quotes])
```

Examples of the htmlentities() function

An example that doesn't use the htmlentities() function

```
$copyright1 = "\xa9 2017";
echo $copyright1;
```

An example that uses the htmlentities() function

```
$copyright2 = htmlentities("\xa9 2017");
echo $copyright2;
```

**Escape sequences only use in some strings**

- \\
- \'
- \"

Escape sequences used in double-quoted strings and heredocs

- \
- \n
- \t
- \r
- \f
- \v
- \ooo
- \xhh

**Key term**

- Escape sequence

**Escape sequences with single quotes**

```
$dir = 'C:\xampp\php';
$name = 'Mike's Music Store';
$quote = "He said, \"It costs \$12.\"";
$comment1 = "This is a\nmulti-line string.";
$comment2 = 'Not a\nmulti-line string.';
```

**A URL for a list of all PHP string functions**

<http://www.php.net/manual/en/ref.strings.php>

Functions for working with string length and substrings

```
empty($str)
strlen($str)
substr($str, $i[, $len])
```

Code that determines if a string is empty

```
if (empty($first_name)) {
    $message = 'You must enter the first name.';
}
```

Code that gets the length of a string and two substrings

```
$name = 'Ray Harris';
$length = strlen($name);
$first_name = substr($name, 0, 3);
$last_name = substr($name, 4);
$last_name = substr($name, -6);
```

**Functions that search a string**

```
strpos($str1, $str2[, $offset])
stripos($str1, $str2[, $offset])
strrpos($str1, $str2[, $offset])
stripos($str1, $str2[, $offset])
```

Code that searches a string for spaces

```
$name = 'Martin Van Buren';
$i = strpos($name, ' ');
$i = strpos($name, ' ', 7);
$i = strrpos($name, ' ');
```

Code that searches a string for a substring

```
$name = 'Martin Van Buren';
$i = strpos($name, 'Van');
$i = strpos($name, 'van');
$i = stripos($name, 'van');
$i = strpos($name, 'A');
```

**Code that formats a phone number in two ways**

```
$phone = '5545556624';
$part1 = substr($phone, 0, 3);
$part2 = substr($phone, 3, 3);
$part3 = substr($phone, 6);
$format_1 = $part1 . '-' . $part2 . '-' . $part3;
$format_2 = '(' . $part1 . ') ' . $part2 . '-' . $part3;
```

Code that displays each letter in a string on a separate line

```
$input = 'JAN';
for ($i = 0; $i < strlen($input); $i++) {
    $vert_str .= substr($input, $i, 1);
    $vert_str .= '<br>';
}
```

**Code that splits a string into two substrings**

```
$name = 'Ray Harris';
$i = strpos($name, ' ');
if ($i === false) {
    $message = 'No spaces were found in the name.';
} else {
    $first_name = substr($name, 0, $i);
    $last_name = substr($name, $i+1);
}
```

**Key terms**

- Length
- Substring
- Position

**Functions that replace part of a string**

```
str_replace($str1, $new, $str2)
str_ireplace($str1, $new, $str2)
```

Code that replaces periods with dashes

```
$phone = '554.555.6624';
$phone = str_replace('.', '-', $phone);
```

Code that replaces one string with another string

```
$message = 'Hello Ray';
$message = str_ireplace('hello', 'Hi', $message);
```

Functions that modify strings

```
ltrim($str)
rtrim($str)
trim($str)
str_pad($str, $len [, $pad[, $type]])
lcfirst($str)
ucfirst($str)
ucwords($str)
strtolower($str)
strtoupper($str)
strrev($str)
str_shuffle($str)
str_repeat($str, $i)
```

Functions that convert strings and arrays

```
explode($sep, $str)
implode($sep, $sa)
```

How to convert a string to an array

```
$names = 'Mike|Anne|Joel|Ray';
$names = explode('|', $names);
$name1 = $names[0];
$name2 = $names[1];
```

How to convert an array to a string

```
$names = implode('|', $names);
```

How to convert an array to a tab-delimited string

```
$names = implode('\t', $names);
```

Code that trims and pads a string

```
$name = ' ray harris ';
$name = ltrim($name);
$name = rtrim($name);
```

```
$name = str_pad($name, 13);
$name = str_pad($name, 16,
    ' ', STR_PAD_LEFT);
```

```
$name = trim($name);
```

Code that works with capitalization

```
$name = ucfirst($name);
$name = lcfirst($name);
$name = ucwords($name);
$name = strtolower($name);
$name = strtoupper($name);
```

Functions that convert between strings and ASCII integer values

```
chr($value)
ord($string)
```

How to convert an integer value to a character

```
$char = chr(65); // $char is 'A'
$char = chr(66); // $char is 'B'
```

How to convert a character to an integer value

```
$val = ord('A'); // $val is 65
$val = ord('B'); // $val is 66
$val = ord('Bike'); // $val is 66
```

Code that changes the sequence of the characters

```
$name = strrev($name);
$name = str_shuffle($name);
```

Code that repeats a string

```
$sep = str_repeat('*', 10);
```

Key term

- ASCII character set

Functions that compare two strings

```
strcmp($str1, $str2)
strcasecmp($str1, $str2)
strnatcmp($str1, $str2)
strnatcasecmp($str1, $str2)
```

How a case-sensitive comparison works

```
$result = strcmp('Anders', 'Zylka'); // $result = -1
$result = strcmp('Anders', 'zylka'); // $result = 1
$result = strcasecmp('Anders', 'zylka'); // $result = -25
```

How a "natural" number comparison works

```
$result = strcmp('img06', 'img10'); // $result = -1
$result = strcmp('img6', 'img10'); // $result = 1
$result = strnatcmp('img6', 'img10'); // $result = -1
```

How to assign an octal value (base 8)

```
$octal_1 = 0251; // Must begin with 0
$octal_2 = -0262;
```

How to assign a hexadecimal value (base 16)

```
$hex_1 = 0X5F; // Must begin with 0x or 0X
$hex_2 = 0x4a3b; // Upper and lower case allowed
```

How to compare two strings

```
$result = strnatcasecmp($name_1, $name_2);

if ($result < 0) {
    echo $name_1 . ' before ' . $name_2;
} else if ($result == 0) {
    echo $name_1 . ' matches ' . $name_2;
} else {
    echo $name_1 . ' after ' . $name_2;
}
```

Key terms

- Integer
- Whole numbers
- Decimal
- Octal
- Hexadecimal

How to assign a decimal value (base 10)

```
$number_1 = 42;
$number_2 = +72;
$number_3 = -13;
$number_4 = -(-39);
$number_5 = --39; // Error
```

How to find the maximum and minimum integer values (base 10)

```
$max_int = PHP_INT_MAX;
$min_int = (-1 * PHP_INT_MAX) - 1;
```

How to assign floating-point values

Using normal notation

```
$float_1 = 3.5; // Must contain a decimal point
$float_2 = -6.0; // May be negative
$float_3 = .125; // Same as 0.125
$float_4 = 1.; // Same as 1.0
```

Using exponential notation

```
$exp_1 = 9.451e15; // Expands to 9.451 × 1015
$exp_2 = 6.022e+23; // Plus sign is optional
$exp_3 = 1.602e-19; // Exponent may be negative
$exp_4 = 9.806e0; // Exponent may be zero
$exp_5 = -1.759e11; // Mantissa may be negative
$exp_6 = 3e9; // Mantissa may be a whole number
```

Two functions for working with infinity

```
is_infinite($value)
is_finite($value)
```

Working with infinity

Getting an infinite value

```
$inf_x = INF; // Positive infinity, case-sensitive
$inf_x = -INF; // Negative infinity
$inf_x = 1e200 * 1e200; // Result is INF
$inf_x = 1 + INF; // Result is INF
$inf_x = 1 / INF; // Result is 0
$inf_x = 1 / 0; // Generates a warning
```

Testing for an infinite value

```
$result = 1e200 * 1e200;
if (is_infinite($result)) {
    echo('Result was out of range. ');
} else {
    echo('Result is ' . $result);
}
```

How to round a number

```
$subtotal = 15.99;
$tax_rate = 0.08;
$tax = round($subtotal * $tax_rate, 2);
```

How to get the square root of a number

```
$num1 = 4;
$root = sqrt($num1);
```

How to work with exponents

```
$num2 = 5;
$power = pow($num2, 2);
```

Key terms

- Floating-point number
- Floats
- Doubles
- Real numbers
- Exponential notation

How to calculate the distance between two points

```
$x1 = 5; $y1 = 4;
$x2 = 2; $y2 = 8;
$distance = sqrt(pow($x1 - $x2, 2) + pow($y1 - $y2, 2));
```

How to place a maximum bound on a number

```
$value = 15;
$max_value = 10;
$value = min($max_value, $value); // 10
```

URL for a list of all PHP math functions

<http://www.php.net/manual/en/ref.math.php>

Common mathematical functions

```
abs($value)
ceil($value)
floor($value)
max($n1, $n2[, $n3] ...)
min($n1, $n2[, $n3] ...)
pi()
pow($base, $exp)
round($value[, $precision])
sqrt($value)
```

Functions that generate random numbers

```
rand($min, $max)
mt_rand($min, $max)
random_int($min, $max)
```

How to simulate a random dice roll

```
$dice = random_int(1, 6);
```

How to generate a random value between 0 and 1 with 5 decimal places

```
$number = 0;
$places = 5;
for($i = 0; $i < $places; $i++) {
    $number += mt_rand(0,9);
    $number /= 10;
}
echo $number;
```

How to generate a random password

```
$password_length = 8;

// Add a symbol to the password
$symbols = '-!@#%&^*()-_+[]{};:.,<>?';
$symbol_count = strlen($symbols);
$index = random_int(0, $symbol_count - 1);
$password = substr($symbols, $index, 1);

$password .= chr(random_int(48, 57));
$password .= chr(random_int(65, 90));

// Add lowercase letters to reach the specified length
while (strlen($password) < $password_length) {
    $password .= chr(random_int(97, 122));
}

$password = str_shuffle($password);
echo $password;
```

Key terms

- Format string
- Format code

The sprintf() function

```
sprintf($format, $val1[, $val2] ...)
```

Data type code

Character	Formats...
s	The value as a string.
d	The value as an integer.
f	The value as a floating-point number.
e	The value using exponential notation.
c	An integer value as its corresponding ASCII character.
b	An integer value as a binary number.
o	An integer value as an octal number.
x	An integer value as a hexadecimal number (lowercase).
X	An integer value as a hexadecimal number (uppercase).

The parts of a format code

Specifier	Required?
%	Required
Sign	Optional
Alignment	Optional
Padding	Optional
Width	Optional
Precision	Optional
Data Type	Required

A sprintf() function that formats two values

```
$message = sprintf('The book about %s has %d pages.',
    'PHP', 800);
```

How to use sprintf() to convert numbers to strings

```
$s1 = sprintf('It cost %s dollars', 12);
$s2 = sprintf('%s', 4.5);
$s3 = sprintf('%s', 9451000.000000);
$s4 = sprintf('%f', 9.451e6);
$s5 = sprintf('%e', 9451000.000000);
$s6 = sprintf('%c', 65);
$s7 = sprintf('%x', 15);
$s8 = sprintf('%X', 15);
$s9 = sprintf('%s%%', 4.5);
```

How to use the optional specifiers

```
$s1 = sprintf("%+d", 42);
$s2 = sprintf("%+d", -42);
$s3 = sprintf("%10s", 'PHP');
$s4 = sprintf("%-10s", 'PHP');
$s5 = sprintf("%-*10s", 'PHP');
$s6 = sprintf("%6d", 42);
$s7 = sprintf("%06d", 42);
$s8 = sprintf("%02d-%02d-%04d", 9, 5, 2017);
$s9 = sprintf("%010.2f", 123.456);
```

How to generate a random HTML color

```
$color = '#';
for($i = 0; $i < 6; $i++) {
    $color .= sprintf("%x", mt_rand(0,15) );
}
echo $color;
```

Two functions for converting strings to numbers

```
intval($var)
floatval($var)
```

Key terms

- Type casting
- Cast

How to convert a string to an integer

Using type casting

```
$value_1 = (int) '42';
$value_2 = (int) '42.5';
$value_3 = (int) '42 miles';
$value_4 = (int) '2,500 feet';
$value_5 = (int) 'miles: 42';
$value_6 = (int) 'miles';
$value_7 = (int) '10000000000';
$value_8 = (int) '042';
$value_9 = (int) '0x42';
```

Using the intval() function

```
$value = intval('42');
```

How to convert a string to a floating-point number

Using type casting

```
$value_1 = (float) '4.2';
$value_2 = (float) '4.2 gallons';
$value_3 = (float) 'gallons';
$value_4 = (float) '1.5e-3';
$value_5 = (float) '1e400';
```

Using the floatval() function

```
$value = floatval('4.2');
```
